

The [Tsokos Lab](#) at the Beth Israel Medical Center of Harvard Medical School, Boston has postdoctoral openings in:

- a) Cell signaling,
- b) Gene transcription,
- c) Establishment and study of genetically engineered mice.

The lab conducts research in patients with systemic lupus erythematosus to identify new molecular treatment targets and disease biomarkers. We study immune cell signaling and gene transcription in patients with lupus and we construct mice to establish the truth of our findings in vivo. Talented young investigators interested in the field of systemic autoimmunity and appropriate expertise may send queries to [gtsokos@bidmc.harvard.edu](mailto:gtsokos@bidmc.harvard.edu).
